But need to solve "chicken and egg problem":
Prover must commit to polynomials before knowing the challenge point.

Polynomial commitment schemes [KZG, 10]

- ▶ Prover send short commitment $\text{cm}(\mathbf{f})$ to polynomial.

- ▶ Later Verifier can choose value $i \in \mathbb{F}$.

Idealized Polynomials Protocols

Preprocessing/inputs: \mathcal{P} and \mathcal{V} agree in advance on $\mathbf{g}_1, \dots, \mathbf{g}_t \in \mathbb{F}_{<d}[\mathbf{X}]$.

Protocol:

1. \mathcal{P} 's msgs are to ideal party \mathbf{I} . Must be $\mathbf{f}_i \in \mathbb{F}_{<d}[\mathbf{X}]$.
2. At protocol end \mathcal{V} asks \mathbf{I} if some (constant number) of identities hold between $\{\mathbf{f}_1, \dots, \mathbf{f}_\ell, \mathbf{g}_1, \dots, \mathbf{g}_t\}$. Outputs **acc** iff they do.

$$\mathfrak{d}(\mathbf{P}) := \left(\sum_{i \in [\ell]} \deg(f_i) + 1 \right)$$

¹similar statements in Marlin/Fractal/Supersonic

$$\mathfrak{d}(\mathbf{P}) := \left(\sum_{i \in [\ell]} \deg(f_i) + 1 \right)$$

Thm:¹ Can compile to “real” protocol in Algebraic Group Model, where prover complexity $\mathfrak{d}(\mathbf{P})$.

Multiset equality check - polynomial version

Given $\mathbf{f}, \mathbf{g} \in \mathbb{F}_{\langle d \rangle}[\mathbf{X}]$, want to check $\{\mathbf{f}(\mathbf{x})\}_{\mathbf{x} \in \mathbf{H}} \stackrel{?}{=} \{\mathbf{g}(\mathbf{x})\}_{\mathbf{x} \in \mathbf{H}}$ as multisets

Reduces to:

$$\mathbf{H} = \{\alpha, \alpha^2, \dots, \alpha^n\}.$$

\mathcal{P} has sent $f', g' \in \mathbb{F}_{\langle n \rangle}[\mathbf{X}]$.

Wants to prove:

$$\prod_{i \in [n]} f(\alpha^i) = \prod_{i \in [n]} g(\alpha^i)$$

$$f := f' + \gamma, g := g' + \gamma$$

Multiplicative subgroups:

$$\mathbf{H} = \{ \alpha, \alpha^2, \dots, \alpha^n = 1 \}.$$

L_i is i 'th lagrange poly of \mathbf{H} :

$$L_i(\alpha^i) = 1, L_i(\alpha^j) = 0, j \neq i$$

Checking products with \mathbf{H} -ranged protocols [GWC19]

 $\mathbf{Z}(\alpha) = 1, \mathbf{Z}(\alpha^i) = \prod_{j < i} \mathbf{f}(\alpha^j) / \mathbf{g}(\alpha^j)$.
2. Sends \mathbf{Z} to \mathbf{I} .

1. \mathcal{P} computes \mathbf{Z} with
 $\mathbf{Z}(\boldsymbol{\alpha}) = 1, \mathbf{Z}(\boldsymbol{\alpha}^i) = \prod_{j \neq i} \mathbf{f}(\boldsymbol{\alpha}^j) / \mathbf{g}(\boldsymbol{\alpha}^j)$.
2. Sends \mathbf{Z} to \mathbf{I} .
3. \mathcal{V} checks following identities on \mathbf{H} .

$$\mathfrak{d}(\mathbf{P}) = \deg(\mathbf{s}) + \deg(\mathbf{Z}) + \mathbf{D} - |\mathbf{H}| = 3n + 4M.$$

Given integer d decomposing each element to d elements in range $M^{1/d}$ can give us

$$d(P) = 4dn + 4M^{1/d}$$

(by sending an auxiliary polynomial of degree $< dn$ with the decomposition of each element and then running the $M^{1/d}$ size range proof on this polynomial).

Question: can we do better?
